

Prescribing of high strength fluoride toothpastes, fluoride mouthwashes and fluoride tablets

Colgate Duraphat[®] is a high strength fluoride toothpaste containing either 2800ppm (parts per million) fluoride or 5000ppm fluoride. These are also known or prescribed as sodium fluoride dental paste 0.619% (2800ppm) or 1.1% (5000ppm).

High strength fluoride toothpastes, fluoride mouthwashes and fluoride tablets are not recommended for GP prescribing as acute or repeat FP10 prescriptions, and should only be prescribed by dentists (please see list of items detailed below).

The Medicines Management Team recommends that the prescribing and continuation of these fluoride dental products should remain under the close supervision of a dentist who can manage the patient's oral health. GPs are responsible for all prescribing decisions they make and for any consequent monitoring that is required as a result of the prescription given. The dentist is best placed and the most appropriate clinician to monitor and assess both the benefits and adverse effects of treatment including the risk of patients developing fluorosis.

Dentists can issue NHS prescriptions (FP10D) for medicines, where appropriate, from the Dental Practitioners' Formulary (DPF) on the NHS, or dentists can issue private prescriptions. Recommendations for prescribing that originate from a dentist or other clinics or departments including restorative dental, should be directed to a dentist for prescribing.

Providers commissioned to provide services on behalf of Thurrock CCG and Basildon and Brentwood CCG are reminded that they are required to follow the local joint formulary and prescribing guidance, or relevant Medicines Management agreement.

High strength fluoride toothpastes, fluoride mouthwashes and fluoride tablets are not recommended for GP prescribing

Please see overleaf for a list of fluoride products which are not recommended for GP prescribing.
